Title:	PT-symmetry and supersymmetry: interconnection of broken and unbroken phases
Authors:	Modak, Subhrajit (/jspui/browse?type=author&value=Modak%2C+Subhrajit)
Keywords:	PT-symmetry supersymmetry interconnection unbroken phases
Issue Date:	2021
Publisher:	The Royal Society Publishing
Citation:	Proceedings of the Royal Society, 477(2254).
Abstract:	The broken and unbroken phases of PT and supersymmetry in optical systems are explored for a complex refractive index profile in the form of a Scarf potential, under the framework of supersymmetric quantum mechanics. The transition from unbroken to the broken phases of PT-symmetry, with the merger of eigenfunctions near the exceptional point is found to arise from two distinct realizations of the potential, originating from the underlying supersymmetry. Interestingly, in PT-symmetric phase, spontaneous breaking of supersymmetry occurs in a parametric domain, possessing non-trivial shape invariances, under reparametrization to yield the corresponding energy spectra. One also observes a parametric bifurcation behaviour in this domain. Unlike the real Scarf potential, in PT-symmetric phase, a connection between complex isospectral superpotentials and modified Korteweg-de Vries equation occurs, only with certain restrictive parametric conditions. In the broken PT-symmetry phase, supersymmetry is found to be intact in the entire parameter domain yielding the complex energy spectra, with zero-width resonance occurring at integral values of a potential parameter.
