Abstract:	<p>We describe a novel plasma membrane cystine transporter, CgCYN1, from <i>Candida glabrata</i>, the first such transporter to be described from yeast and fungi. <i>C. glabrata</i> met15Δ strains, organic sulfur auxotrophs, were observed to utilize cystine as a sulfur source, and this phenotype was exploited in the discovery of CgCYN1. Heterologous expression of CgCYN1 in <i>Saccharomyces cerevisiae</i> met15Δ strains conferred the ability of <i>S. cerevisiae</i> strains to grow on cystine. Deletion of the CgCYN1 ORF (CAGL0M00154g) in <i>C. glabrata</i> met15Δ strains caused abrogation of growth on cystine with growth being restored when CgCYN1 was reintroduced. The CgCYN1 protein belongs to the amino acid permease family of transporters, with no similarity to known plasma membrane cystine transporters of bacteria and humans, or lysosomal cystine transporters of humans/yeast. Kinetic studies revealed a K_m of $18 \pm 5 \mu M$ for cystine. Cystine uptake was inhibited by cystine, but not by other amino acids, including cysteine. The structurally similar cystathionine, lanthionine, and selenocystine alone inhibited transport, confirming that the transporter was specific for cystine. CgCYN1 localized to the plasma membrane and transport was energy-dependent. Functional orthologues could be demonstrated from other pathogenic yeast like <i>Candida albicans</i> and <i>Histoplasma capsulatum</i>, but were absent in <i>Schizosaccharomyces pombe</i> and <i>S. cerevisiae</i>.</p>
