Title:	Optical detection of nanometric surface dynamics of an evaporating sessile droplet
Authors:	Verma, Gopal (/jspui/browse?type=author&value=Verma%2C+Gopal) Singh, K.P. (/jspui/browse?type=author&value=Singh%2C+K.P.)
Keywords:	Nanometric Surface dynamics Droplet Photonics
Issue Date:	2014
Publisher:	OSA Publishing
Citation:	Proceedings 12th International Conference on Fiber Optics and Photonics, Photonics 2014
Abstract:	We propose a simple optical technique to measure time-resolved nanoscale surface profile of an evaporating sessile fluid droplet. By analyzing Newton ring like high contrast fringes we demonstrated $\lambda/100 \approx 5$ nm sensitivity in surface height change of the air-water interface. This allowed us to precisely measure transient surface dynamics during the contact-line slips, weak perturbations on the evaporation due to external magnetic field and partial confinement of the drop. Further, we demonstrate wide applicability of this technique by measuring the nanoscale surface dynamics of the water drop resting on a deformable oil interface.
