Title:	Auto-feeding microbial fuel cell inspired by transpiration of plants
Authors:	Patil, Sunil A. (/jspui/browse?type=author&value=Patil%2C+Sunil+A.)
Keywords:	Auto-feeding Microbial fuel cell Hydrogel electrolyte Transpiration Air-cathode Capillary
Issue Date:	2018
Publisher:	Elsevier Ltd
Citation:	Applied Energy, 225, pp. 934-939
Abstract:	Inspired by the transpiration process in plants, we report an auto-feeding microbial fuel cell (AF-MFC), in which the fuel (substrate solution) is fed automatically through a process similar to transpiration in natural plants without using any external equipment and applying extra power. The AF-MFC consisted of a bioanode, an air-cathode, hydrogel electrolyte, and a glass capillary feeding channel. The auto-feeding process was realized by the fact that evaporative loss of water from the air-cathode of the AF-MFC reduces pressure in the hydrogel electrolyte; which, in turn, pulls substrate solution to the AF-MFC to maintain hydration of the hydrogel electrolyte. The AF-MFC was able to generate a stable voltage of 0.55 V across a 1000 $\Omega$ resistor and a maximum power density of $1182 \pm 115$ mW m <sup>-2</sup> (normalized to the projected area of air-cathode) and $295.5 \pm 28.8$ W m <sup>-3</sup> (normalized to the total volume of the MFC). This study thus provides a new way to fabricate self-sustaining portable MFCs and greatly simplifies the feeding system of the MFCs.
