Publisher:	Royal Society of Chemistry
Citation:	RSC Advances, 6(81), pp. 80718-80722
Abstract:	An effective method for the synthesis of unsymmetrical allyldiaryl methanes is portrayed. This protocol involves a Lewis acid catalysed 1,6-conjugate addition of allyltrimethyl silanes to paraquinone methides, which enabled us to synthesize a variety of unsymmetrical allyl diarylmethane in good to excellent yields in a very short reaction period.
